To: Colleagues

From: George A. Morgan

Subject: Available Reprints on Research Methods and Statistics

If you are interested in any of the reprints or preprints on the attached list and do not have easy access to them, I would be pleased to send them to you.

Articles 1-33 are from the series “Clinicians Guide to Research Methods and Statistics” published in the Journal of the Academy of Child and Adolescent Psychiatry. The articles were later revised and published in a textbook by Morgan, Gliner and Harmon (2006), Understanding and Evaluating Research in Applied and Clinical Settings. Mahwah, NJ: Erlbaum. The articles and the book are intended to help clinicians and graduate students in applied areas read, understand, and evaluate research articles.

The other articles and chapters are on various research methods and statistics topics published in a variety of places.

Probably the three most original and, I think, important ones are #33 on measures of clinical significance by Helena Kramer, et al., #35 on NHST and effect sizes, and #37 on communicating judgments about practical significance.
